## Ejectors

### Overview

Graham ejector systems deliver the answers you need. Whether your requirement is for a single stage ejector or a multiple stage ejector system, Graham can provide what is needed. Ejector systems are available with direct contact or surface type inter and after condensers. The systems can be provided as components only or in complete packages. Materials of construction can be any weldable material, as well as graphite or engineered plastics.

Ejector systems can be designed for suction pressures as low as 10 microns or inlet pressure can be above atmospheric pressure for pressure boosting or thermal compression type applications.
